

OMAN (OMN_S_002)

Through MARS, UNEP's International Methane Emissions Observatory (IMEO) turns satellite data into methane action. MARS is the only public global satellite-based system alerting governments and companies of extreme methane emissions. Using 30+ satellite instruments, combined with expert analysis and AI models, MARS detects major emission events and enables rapid response.

Oil & Gas

SOURCE TYPE
Flare

TOTAL NUMBER OF PLUMES DETECTED
1

DATE OF FIRST DETECTION
29 January 2023

DATE OF REPORTED MITIGATION
16 January 2024

ESTIMATED TOTAL VOLUME OF
EMISSIONS

25,000 tonnes

SAME CLIMATE IMPACT AS

~480,000 cars

DRIVEN FOR A YEAR

DETECTION & ACTION

THE CAUSE AND THE SOLUTION

The emissions were caused by unlit flaring. The operator adjusted the pilot gas flow to an appropriate level and safely reignited the flare.

The image shows a plume detected by NASA's EMIT in Oman, on 29 January 2023. No further emissions have been detected at the location since 16 January 2024.

In implementing MARS, UNEP collaborates with various institutional partners, including the World Bank, International Energy Agency, the Climate and Clean Air Coalition, Universitat Politècnica de València, the Netherlands Institute for Space Research, the Committee on Earth Observation Satellites and the Copernicus Atmosphere Monitoring Service.

Based on satellite data used by MARS, it is not possible to confirm the presence of minimal methane emissions at a given location. Rather, this data can confirm the absence of emissions at levels higher than a given satellite's detection limit, which varies based on the technology, ground conditions and the weather.
